

**Comprehensive Sex Education: Good for your kids?
THINK AGAIN!
ANAHEIM PARENTS JOIN US TO STOP THIS AGENDA
OCTOBER 24, 2018 at 6:30 PM**

Orange Grove Elementary School, 1000 S. Harbor, North Campus, Anaheim,
California 92805.

This program is just another corrupt attempt to shove the perverse LGBT agenda onto YOUR CHILDREN! The LGBT population suffers disproportionately from sexually transmitted diseases (including HIV/AIDS), psychological distress, and suicide.

Dangerous homosexual practices lead to shortened lifespan. Transgender persons suffer a suicide attempt rate of over 40% in the US, and in Sweden a rate of death by suicide 20 times that of non-transgenders. Medical “gender transition” surgeries result in sterility, damaged bodies, and dangerous long-term effects from puberty blockers and opposite-sex hormones.

LGBT “identities” should not be promoted to children!

Other disturbing statistics about homosexuality and transgenderism:

Health Risks of the Homosexual Lifestyle: Sexual relationships between members of the same sex, however, expose gays, lesbians and bisexuals to extreme risks of Sexually Transmitted Diseases (STDs), physical injuries, mental disorders and even a shortened life span.

Levels of Promiscuity: Common sexual practices among gay men lead to numerous STDs and physical injuries, some of which are virtually unknown in the heterosexual population. Lesbians are also at higher risk for STDs. In addition to diseases that may be transmitted during lesbian sex, a study at an Australian STD clinic found that lesbians were three to four times more likely than heterosexual women to have sex with men who were high-risk for HIV.

It is well established that there are high rates of psychiatric illnesses, including depression, drug abuse, and suicide attempts, among gays and lesbians. This is true even in the Netherlands, where gay, lesbian and bisexual (GLB) relationships are far more socially acceptable than in the U.S.

Life Span: The only epidemiological study to date on the life span of gay men concluded that gay and bisexual men lose up to 20 years of life expectancy. **Monogamy:** Monogamy, meaning long-term sexual fidelity, is rare in LGBT relationships, particularly among gay men. One study reported that 66 percent of gay couples reported sex outside the relationship within the first year, and nearly 90 percent if the relationship lasted five years.

Other Health Risks: It is clear that there are serious medical consequences to same-sex behavior. Identification with an LGBT community leads to an increase in promiscuity, which in turn leads to a myriad of Sexually Transmitted Diseases and even early death. Youth should be warned of the undeniable health risks associated with a homosexual lifestyle.
